ShipServ™ Developed by Integrated Systems

ShipServ offers a simple method to create shipments, view package history and create department expenditure reports.

Browser-based assistant for Desktop shipping!

Create shipments from any Windows® based PC on your company Intranet using your web browser.

- No special software to install on the ship request PCs

- Instant visibility to package details upon shipping

Your keys to a simplified way of shipping samples, returns, or other non-revenue based items.

Also great for automating mail room shipping using carrier provided manifest systems!

Getting started

Open your favorite web browser and navigate to the ShipServ URL. Enter your name and choose from a list of available departments.

To create a new shipment, click the address book icon to select from previously saved recipients or enter a new recipient address.

Select the desired carrier, shipping service and billing method. You can also send a custom message to the shipper.

When finished, ShipServ will print a barcoded shipping receipt to your preferred office printer. The order is then sent to shipping for processing.

The shipper simply scans the barcoded shipping receipt and prints a shipping label.

The shipping software will then automatically update ShipServ with shipping costs, ship date/time and tracking number.

You'll have the peace of mind knowing your product was shipped exactly as intended – along with the ability to track your package's progression with the carrier to ensure its proper delivery!
