

WinServ™

a clear view to
all your shipping data

Manage distribution, track shipments & enhance customer service with real-time package details from any workstation in your enterprise.

WinServ™ is a powerful search engine optimized to scan your historical shipping data and return relevant results in tabular format.

Its built in web browser allows users to track packages for delivery and transit information from within your results window.

Personalized Searching

Data Views can be created as needed to give users only the data they need. Your Customer Service staff may only want tracking numbers, where the Accounting Group may want to view costs and billing information and your Shipping Manager may want to know who processed a package and when.

Primarily designed for **KEWILL** **Clippership®** shipping solutions, its flexible database viewer also enables users to view any Microsoft Access, dBase formatted files or ODBC connections to other database types. And its network friendly & multi-user aware interface lets users share data views throughout your organization, saving costly setup time.

As a featured bonus, results may be exported to a text file or Excel Spreadsheet for later analysis.

Be the first to know...

Add a WinServ™ viewer to search the current open shipments. Instantly obtain who shipped the package, what time it was shipped, what carrier will be picking it up and the charges incurred.
